Summary

Software Engineer with 2+ years of experience building scalable backend systems and customer-facing APIs using Python, Django, PostgreSQL, Redis, and AWS. Proven experience integrating third-party services, designing fault-tolerant asynchronous workflows, and owning features from design to production. Passionate about distributed systems, fintech, and building reliable payment products used by millions of customers.

Technical Skills

Languages: Python, Go, TypeScript, JavaScript
Frameworks & APIs: Django, Django REST Framework, FastAPI, Node.js, REST APIs, WebSockets, gRPC
Databases & Messaging: PostgreSQL, Redis, MySQL, Celery, Redis Streams
Cloud & DevOps: AWS (EC2, S3), Docker, Nginx, GitHub Actions, CI/CD
Observability: Structured Logging, Prometheus, Grafana
Core Concepts: Distributed Systems, Fault Tolerance, Idempotency, Third-Party Integrations, Payment Systems

Experience

Software Developer

Sept. 2024 – Present

Noovosoftware Technologies LLP (Client: **Farmdesk.eu**)

Pune, Maharashtra

- Designed and shipped Farmdesk's payments system from scratch on **Mollie**, covering the full subscription lifecycle — first payment, recurring billing, retry-on-failure, cancellation, and reactivation — across the full set of EU payment methods. Built failure-first throughout: idempotency keys against double-charges, webhook reconciliation for missed events, token-expiry email flows that keep users in the loop, and EU billing/invoicing compliance.
- Built an AI agent that auto-resolves production errors surfaced by **Sentry** — clones the repo, reads the trace, decides whether the bug is auto-fixable or needs human review, opens a Bitbucket PR, and iterates on review comments. Cut support ticket volume by ~80%. Runs through scoped Bitbucket and Jira tool calls (not raw API hits) and writes findings back to Confluence so the docs stay current.
- Stabilized a batch of fragile third-party and government integrations — including several still on SOAP — by moving them onto async **Celery** pipelines with exponential-backoff retries, turning consistently flaky upstreams into something the product could rely on.
- Migrated a fragmented mix of basic-auth and session login (served by a legacy PHP/Laravel auth server) to a JWT access/refresh token system on Django, with configurable token lifetimes and full backward compatibility during the cutover.
- Replaced short-polling endpoints with **SSE** streams for reads (paired with POST for writes), eliminating dropped and delayed updates on live data views.
- Led the frontend team in carving out a shared TypeScript library for the web app and mobile app — pulling common logic and type definitions into one place. Killed off recurring inconsistencies between the two and gave the team a real productivity bump.
- Cut CI pipeline and Docker build times sharply by switching Python tooling to Rust-based replacements (**uv**) across the codebase.
- Built internal profiling tooling on top of existing open-source profilers to surface slow paths and bad patterns we'd been blind to, and worked with the team to fix the bottlenecks it uncovered.

Projects

Vartalaap – Group Video Calling | Go, WebRTC, Cloudflare SFU/TURN, Rust (WASM)

2025

- Group video calling app built directly on native WebRTC — Go signaling server paired with Cloudflare's SFU for media routing past the peer-to-peer ceiling (~4–5 users) and Cloudflare TURN for NAT traversal, so calls hold up on real-world networks and scale beyond small groups.
- Wrote the frontend against the WebRTC APIs without an SDK wrapper, and integrated a Rust-based WASM module for in-browser noise suppression and echo cancellation — keeping HD audio and video stable across long-duration calls.

Servio – Self-Hosted Systemd Service Manager | Go, Linux (systemd), WebSocket

Dec. 2025

- Self-hosted alternative to a PaaS — a small Go web UI that drives systemd directly, so you can deploy, monitor, and manage services on your own Linux box without renting a cloud layer on top. One-click start/stop/restart, with live log tailing piped from **journald** and process **stdout** into the browser over WebSocket.
- Handles deploys end-to-end: clones the repo, injects env vars, builds the binary on the server, and hands it off to systemd to run as a managed service.

django-silky | Python, Django, Open Source

2025

- Drop-in UI modernization of **django-silk** (a Django profiling tool with 4.9k GitHub stars) — published on PyPI with **4k+** downloads organically (zero promotion), 12+ stars, and a PR open upstream to **jazzband/django-silk** to fold the work back in.
- N+1 query detection** with a request-level banner and per-query cost badges.

Education

Pune University

2021 – 2024

Bachelor of Engineering in Computer Engineering, CGPA: 8.8/10

Pune, Maharashtra

Government Polytechnic, Amravati

2018 – 2021

Diploma in Computer Engineering, 96%

Amravati, Maharashtra
